Research Interest

- Using modern synthetic chemistry methods, synthesizing new chemical entities for pharmaceutical drug discovery and development.
- A major problem in organic synthesis is that most synthetic procedures leave much to be desired regarding efficiency, reliability and predictability. By tackling challenging targets I have tested these procedures fully and obtained a better understanding of the chemical processes involved. From this understanding, I can improve existing methodologies and discover new ways of building organic molecules.
- Development of new drugs including acetyl acetylcholinesterase (AChE) inhibitors (Alzheimer drug), anti-cancers, neuroprotective agents and anti-virals by organic syntheses.
- Developing synthetic tools (reactions and reagents) and networks of reactions (synthetic strategies) for efficient and selective chemical synthesis. In particular, I have focused on the development of chemical transformations that can resolve

longstanding synthetic problems and offer new mechanistic vistas for future development in organic synthesis.

- The development of new synthetic methodologies for bioactive heterocycles, especially by employing the principles of green chemistry.
- Molecular simulation
